

Web App SPA and Backend

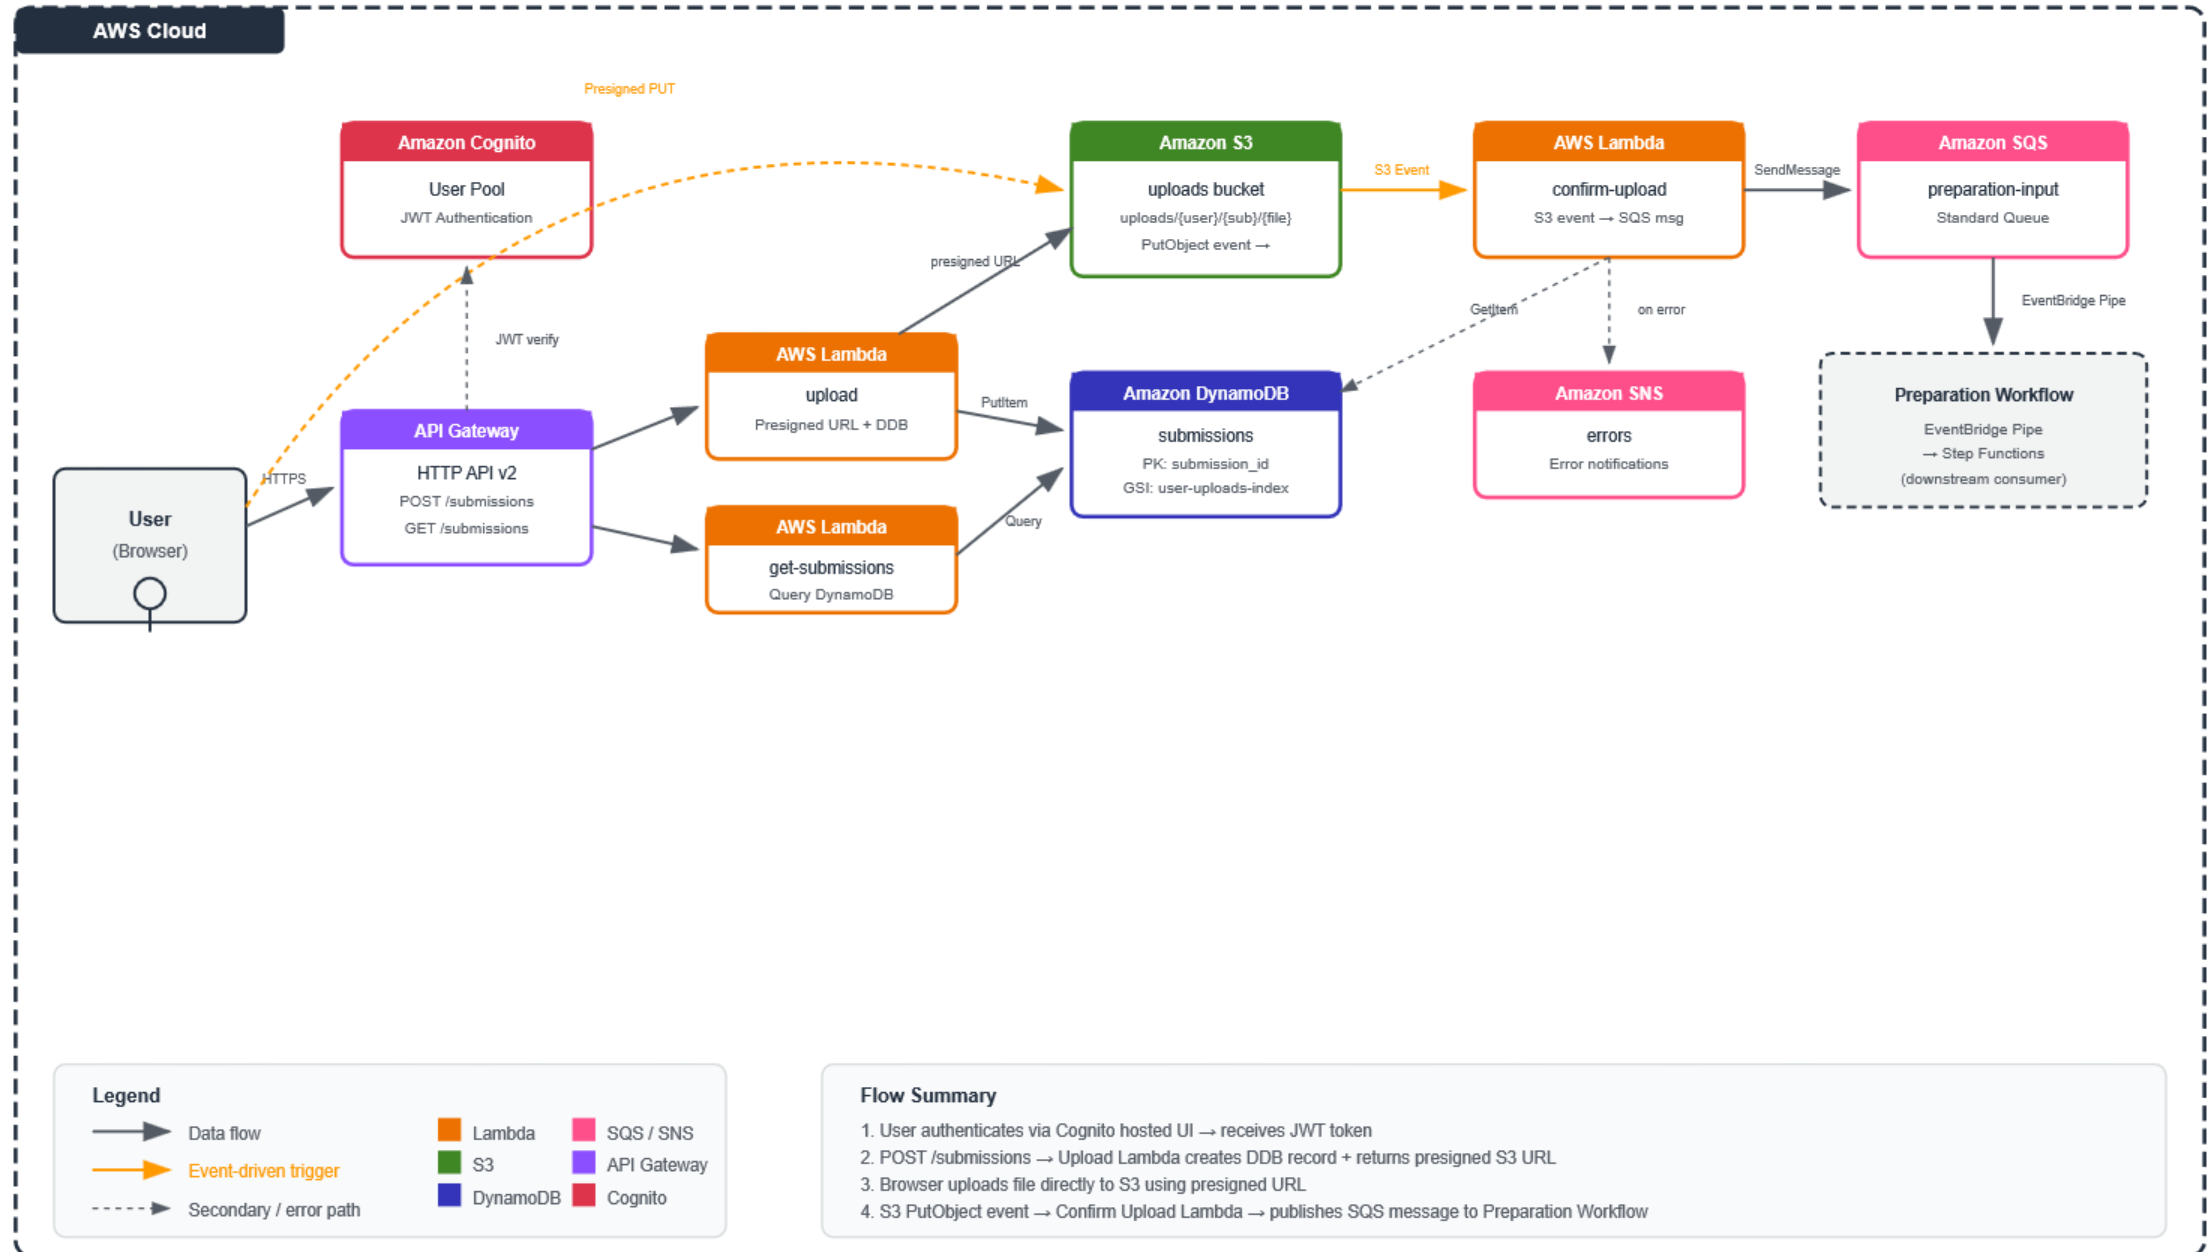

Ask

- Are VPC Endpoints used between AOI Gateway and Lambdas
- Are Interface VPC Endpoints used between Lambdas and DynamoDB and S3?
- Are Lambdas full insulated from AZ failures?
- Where is SQS?
- Where is SNS?

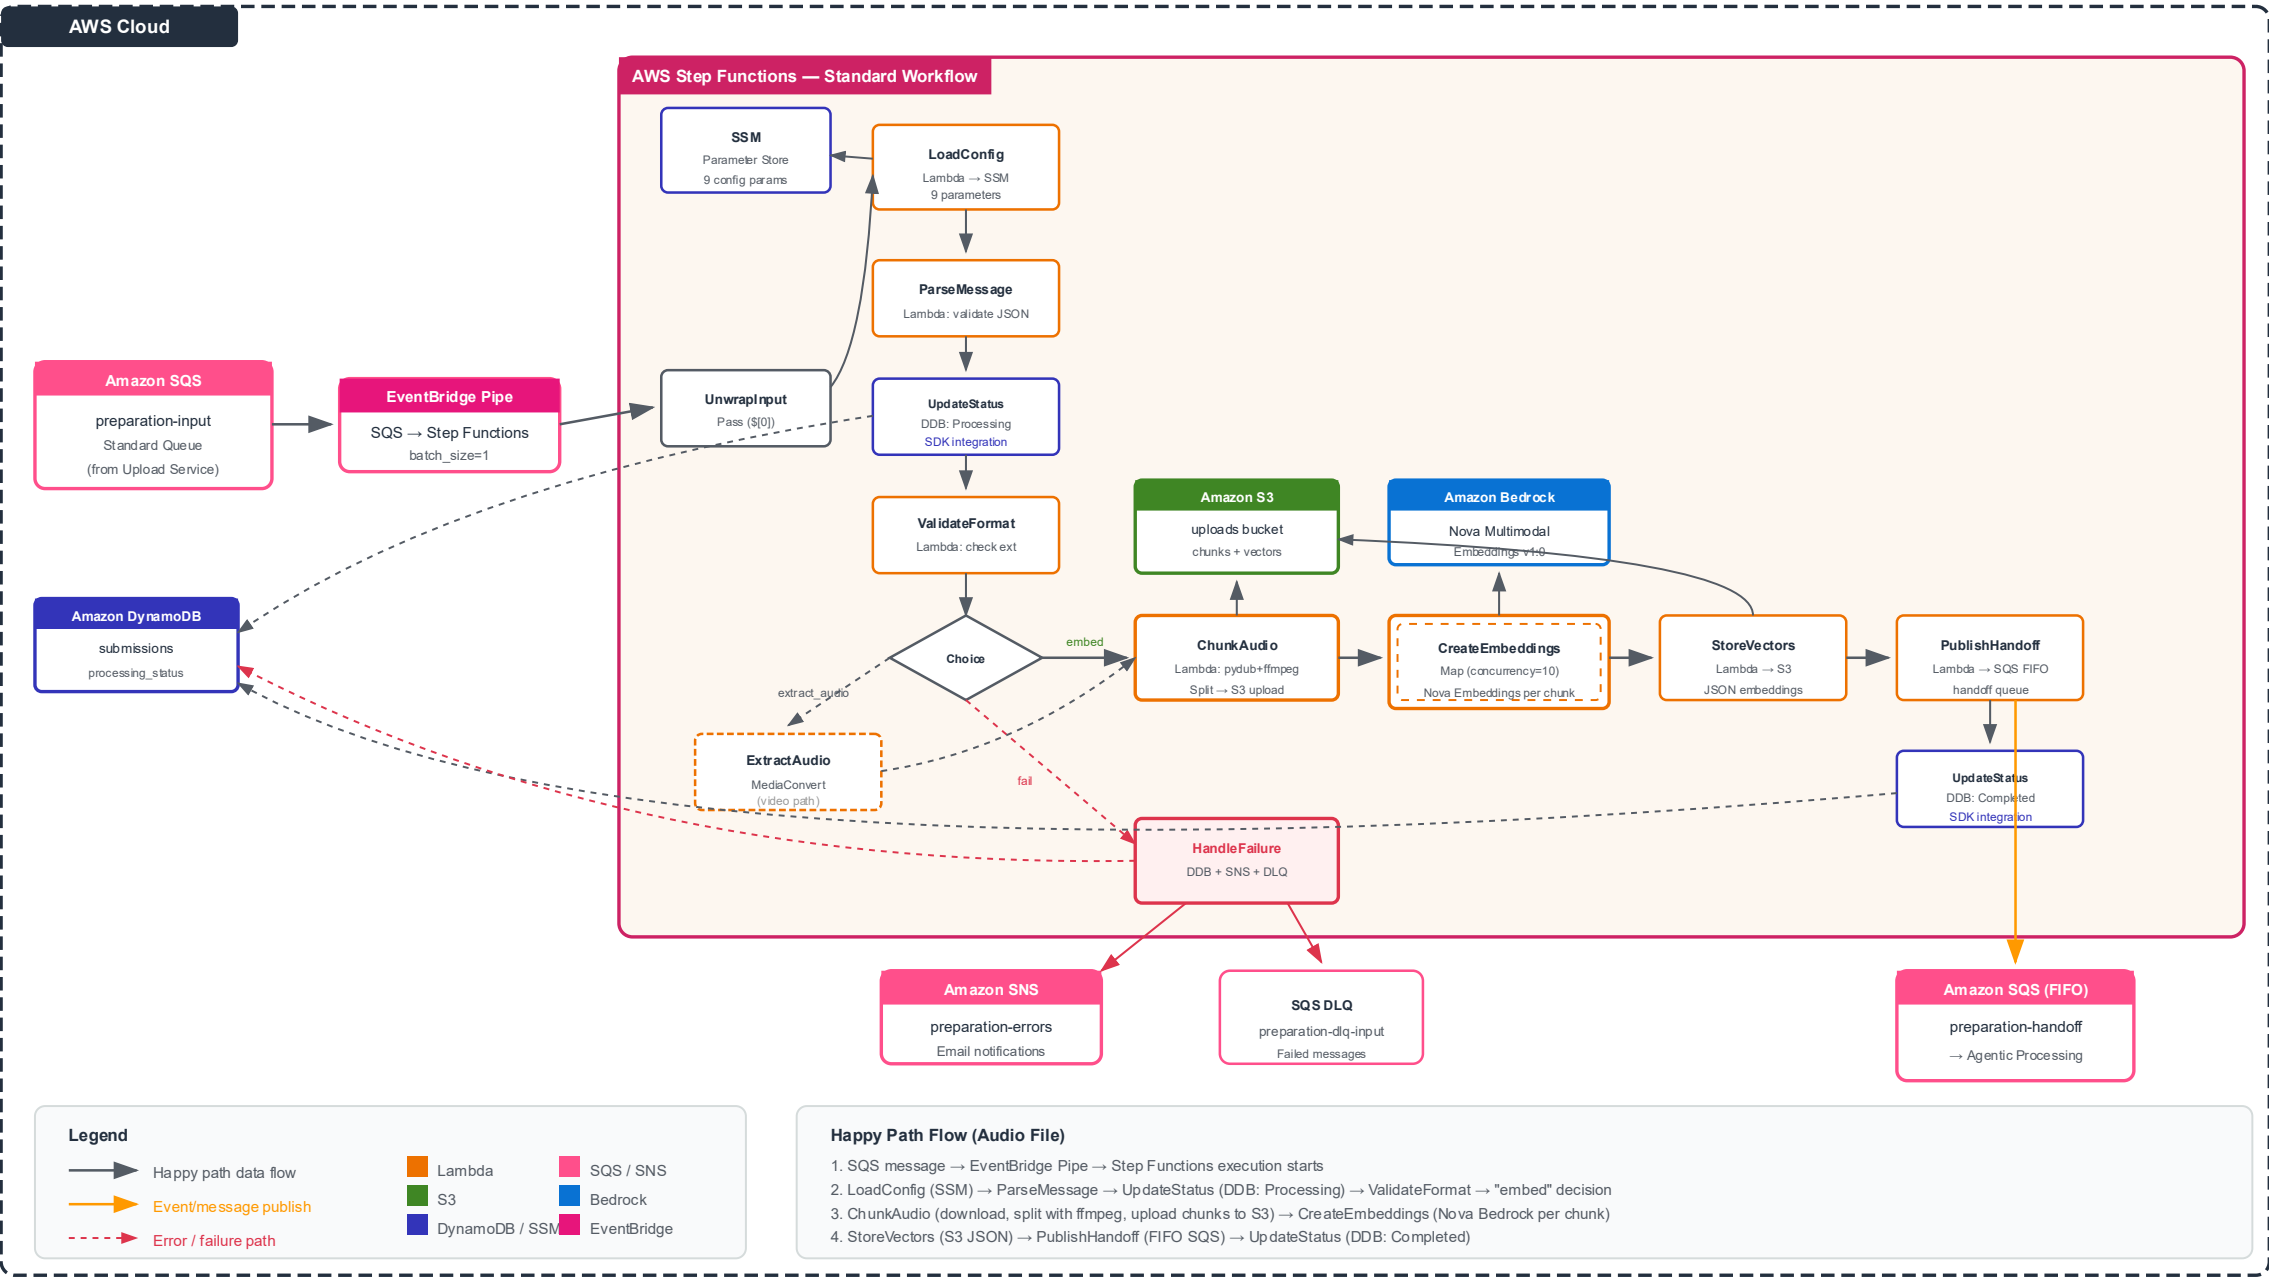

Upload and Storage Service — Architecture Diagram

Agentic Evaluation — LOCAL MODE Architecture (Current Deployment)

ECS Fargate Spot | Strands SDK Local Execution | Direct Bedrock InvokeModel

Agentic Evaluation — AGENTCORE MODE Architecture (Future Deployment)

Amazon Bedrock AgentCore Runtime | Managed Agents | Session Memory | Auto-Scaling

Did I ask Kiro to be Jiminy F'ing Cricket?

This is a good stopping point for tonight.

Kiro

There are two issues visible:

Issue 1: Vector store retrieval is broken — The evaluators pass the S3 file key (`uploads/e498e408.../1_Introducing AgentCore.mp3`) as the `knowledgeBaseId` parameter to `bedrock-agent-runtime:Retrieve`. That's wrong — `knowledgeBaseId` expects a Bedrock Knowledge Base ID (10-char alphanumeric like `ABCDE12345`), not an S3 path. The evaluator code in `_retrieve_content()` uses `input.s3_key` as the knowledge base ID, which is the bug.

Issue 2: Collected 0 result(s), 0 failure(s) — The agents actually ran (the model calls succeeded — no model errors this time!) but returned results that the coaching supervisor couldn't parse. The Strands Agent orchestration likely returned text that didn't match the JSON pattern the `_parse_results_from_response()` method looks for. The fallback `_direct_invoke_tools()` path wasn't triggered because the agent call didn't raise an exception — it just returned unparseable content.

What needs fixing:

1. The vector store retrieval is a secondary issue (it falls back to empty content gracefully). The primary issue is that the coaching supervisor's agent-based orchestration succeeded but returned results in a format the parsing code doesn't handle.
2. Since we don't have a Bedrock Knowledge Base set up, the evaluators are running with empty content and the LLM is responding with its analysis of nothing — likely in a format the JSON parser can't extract.

This is a good stopping point for tonight. The infrastructure is fully working end-to-end. The remaining issues are application logic:

- Either set up a Bedrock Knowledge Base or change the evaluators to read embeddings from S3 directly (which is where the prep workflow stored them)

Want me to create a prioritized issue list for these remaining fixes?

Busy couple days. I had to upgrade to the Pro+ (2000 credits plan) after hitting the app hard the last few days

 Kiro

Accepted creation of `remaining-issues.md`

Commit message:

`docs: add remaining-issues.md with prioritized fix list for evaluation pipeline`

The three critical fixes in order:

1. Bypass Strands Agent orchestration → use direct tool invocation (coaching supervisor produces 0 results because it can't parse the agent response)
2. Fix vector store retrieval → read embeddings from S3 directly or pass audio to Claude multimodal
3. Improve JSON response parsing in evaluators

The infrastructure is fully operational — these are application logic bugs that need code fixes in the evaluator agents and coaching supervisor.

Est. Credits Used: 3.16 Elapsed time: 1m 7s
